Session 15
Combinatorics,
Encoding, Search

#### **Session Goals**

- Trace how recursion can be used to calculate factorials
- Learn the rules for the Scramble Squares puzzle
- Formulate research questions to analyze the puzzle
- Develop a taxonomy to differentiate puzzle images
- Consider how to encode the puzzle pieces
- Develop a method to <u>describe</u> a puzzle solution
- Understand the algorithm to check for a valid layout
- Appreciate how recursion can be used to solve the puzzle

#### Recursion

- Recursion is when a function calls itself
  - Each invocation (call) of the function results in a new instance that gets its own **copy** of all **local variables**
  - Return values in a series of nested recursive calls can be passed all the way back up the call stack to the very first calling instance
- The lack of a terminating condition in any recursive call will result in an infinite loop
  - Runaway recursion will quickly cause a stack overflow
  - When the stack crashes, a segmentation fault and a core dump will occur, and Linux will terminate your app
  - Recursion is very powerful but can be very tricky

#### Open Lab 1 – Factorial Recursive

In mathematics, the **factorial** of a non-negative integer n, denoted by n!, is the product of all positive integers less than or equal to n. For example,

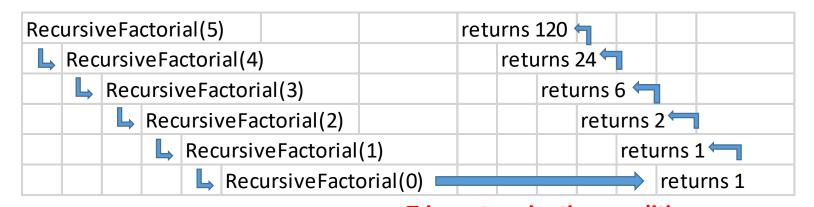

```
5! = 5 \times 4 \times 3 \times 2 \times 1 = 120.
```

The value of 0! is 1, according to the convention for an empty product.<sup>[1]</sup>

```
int IterativeFactorial(int n)
{
    int x = n;
    while (n > 1) {
        n = n-1;
        x = x * n;
    }
    return x;
}
```

```
File Edit View Terminal Tabs Help
Iterative Factorial of 5! = 120
Process returned 0 (0x0) execution
Press ENTER to continue.
```

#### Recursive Factorial Call Stack

```
int IterativeFactorial(int n)
{
    int x = n;
    while (n > 1) {
        n = n-1;
        x = x * n;
    }
    return x;
}
```

```
int RecursiveFactorial(int n)
{
    if (n==0)
        return 1;
    else
        return n * RecursiveFactorial(n-1);
}
```

Recursive code is often a more "natural" expression of the problem

#### Run Lab 1 – Factorial Recursive

```
N! = N*(N-1)!
```

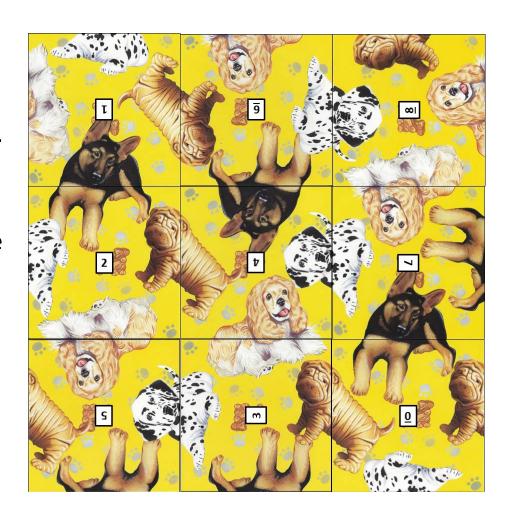

```
int RecursiveFactorial(int n)
{
    if (n==0)
        return 1;
    else
    return n * RecursiveFactorial(n-1);
}
Terminating Condition
```

```
File Edit View Terminal Tabs Help

Recursive Factorial of 5! = 120

Process returned 0 (0x0) executive
Press ENTER to continue.
```

#### Scramble Squares

- There are 9 tiles in a 3 x 3 matrix
- Each tile can be rotated in 4 different positions
- Inside edges of adjacent tiles must make a full image (be complimentary)
- Edges around outside of entire matrix <u>don't</u> need to match the other side
- There may be multiple solutions (layouts) but there is always at least one

#### Frame of Reference

- 60 seconds in one minute
- 60 minutes in one hour
- 24 hours in one day
- 365 days in one year
- $60 \times 60 \times 24 \times 365 =$  **32M**
- Remember this frame of reference:

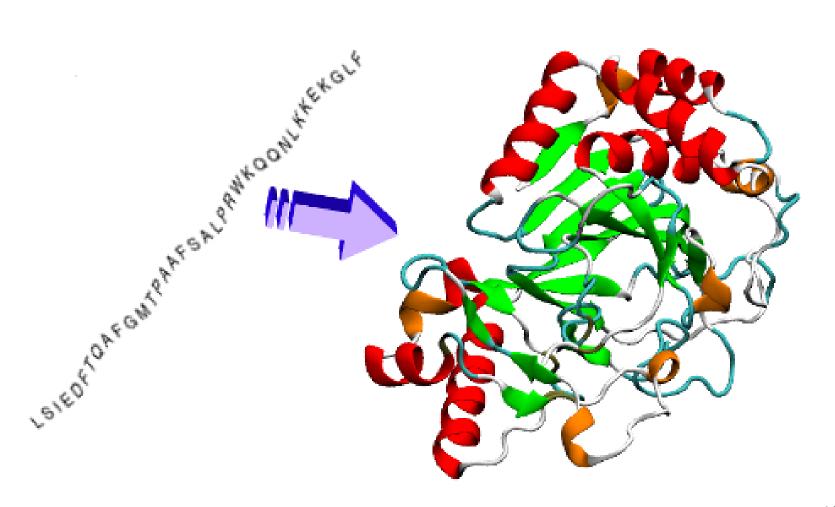

There are only 32 million seconds in a year

### Frame of Reference

- 9 scramble squares
- 4 possible rotations per square
- 9 x 4 = 36 possible "squares"
- 36 permute 9 = \_\_\_\_
- We cannot solve the Scramble Squares problem using brute • Even: force methods! رن try them all !!
- Ren

are only 32 million seconds in a year

## Why study Scramble Squares?

## Why study Scramble Squares?

#### **Scramble Squares**

- 4 image types
- Tiles have binding site
- We cannot solve the protein • Tiles rotate
- haι ima
- ssibleںے Avoid layouts

#### Protein Struct

- ling sites
- folding problem using brute force methods! Jugles Junobic and nydrophilic sections must align
  - Avoid high energy conformations

#### First Things First

- Open the bags carefully they rip easily
- Never write anything directly on a puzzle piece!
- Verify you have 9 puzzle pieces
- Each puzzle has a two letter identifier on the back (bottom right corner) of every piece
- Ensure all 9 pieces in your puzzle have the <u>same</u> two-letter identifier
- Lay all the pieces (picture side up) in a 3 x 3 grid

#### Solve It Like A Scientist!

- Don't just look at the pieces see them
- What research questions can you pose about your puzzle set?
- What types of analysis of each piece could help guide you to a solution?
- How can we encode the order and orientation of each puzzle piece, so you can tell me your solution over the phone?

#### **Research Questions**

1. Which tile has the most number of head images?

Tile	0	1	2	3	4	5	6	7	8
Dalmatian Head					1	1			1
Shar-Pei Head	1		1	1			1		1
Spaniel Head					1	1	1	1	1
Shepherd Head		1			1			1	
Totals	1	1	1	1	3	2	2	2	3

#### **Research Questions**

2. Which tile has the most number of body images?

Tile	0	1	2	3	4	5	6	7	8
Dalmatian Body	1	1	1	1			1	1	
Shar-Pei Body	1	1			1	1			
Spaniel Body		1	1	1					1
Shepherd Body	1		1	1		1	1	1	
Totals	3	3	3	3	1	2	2	2	1

#### **Research Questions**

3. Which breed has the largest *disparity* (difference) between the numbers of head images vs. body images throughout your entire deck?

Tile	0	1	2	3	4	5	6	7	8	Total
Dalmatian Head					1	1			1	3
Dalmatian Body	1	1	1	1			1	1		6
Shar-Pei Head	1		1	1			1		1	5
Shar-Pei Body	1	1			1	1				4
Spaniel Head					1	1	1	1	1	5
Spaniel Body		1	1	1					1	4
Shepherd Head		1			1			1	·	3
Shepherd Body	1		1	1		1	1	1		6

#### Solve It Like A Scientist!

- Now try to solve your Scramble Square puzzle!
- Let the statistics of your puzzle guide you
  - What position is hardest to place?
  - What breed is hardest to match?
- Good scientists keep good notebooks write down what you are doing, why, and what happened
  - Luck is not reproducible! What is your process?
  - Develop a taxonomy for identifying puzzle images

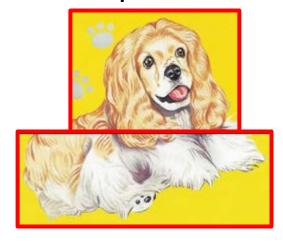

- Create a table with 8 rows x 2 columns
  - 4 species x 2 rows per species (one row for each distinct half image)
  - **Two** columns: one for the half image **identifier**, the other for the **unique value** # for that half image
- Suggested possible identifier prefixes
  - Half image type # 1: Top, Head, Front, Bow, Eyes, Mouth, Beak, Flowers, Northern Hemisphere, etc.
  - Half image type # 2: Bottom, Body, Back, Stern, Tail, Feet, Talons, Bumper, Stem, Base, Basket, Southern Hemisphere, etc.

Half Image Identifier	Value
Your Species # 1 - Half Image # 1 Identifier	1
Your Species # 1 - Half Image # 2 Identifier	2
Your Species # 2 - Half Image # 1 Identifier	3
Your Species # 2 - Half Image # 2 Identifier	4
Your Species # 3 - Half Image # 1 Identifier	5
Your Species # 3 - Half Image # 2 Identifier	6
Your Species # 4 - Half Image # 1 Identifier	7
Your Species # 4 - Half Image # 2 Identifier	8

**Dalmatian** 

**Spaniel** 

Shar-Pei

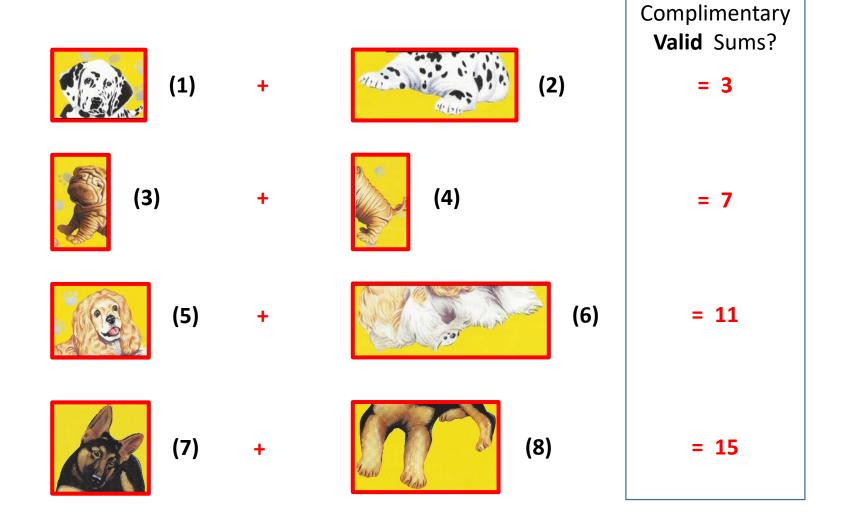

**Shephard** 

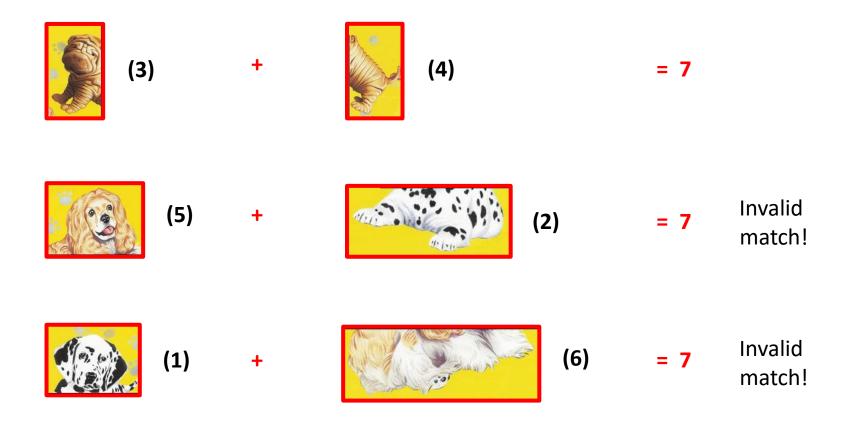

Half Image Identifier	Value
Dalmatian Head	1
Dalmatian Body	2
Shar-Pei Head	3
Shar-Pei Body	4
Spaniel Head	5
Spaniel Body	6
Shephard Head	7
Shephard Body	8

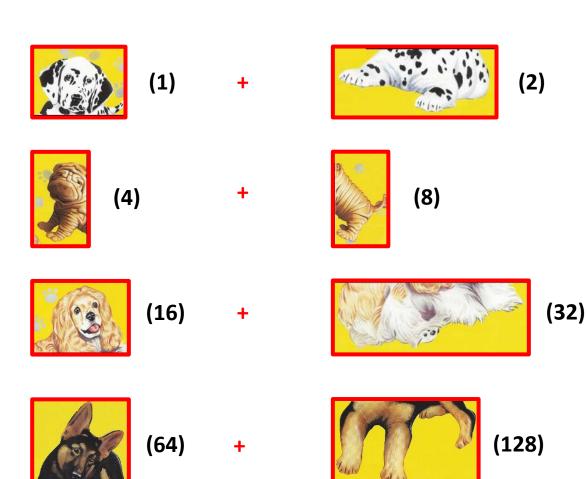

## Encoding Half Images (Base 10)

## The Problem With Base 10

## Encoding Half Images (Powers of 2)

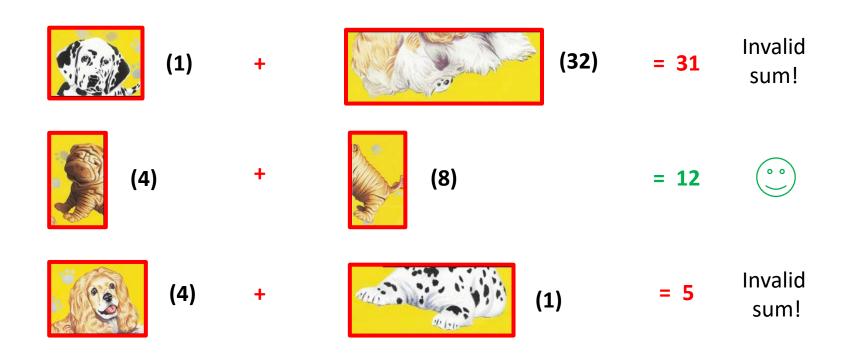

Only

valid

matches

can

## Encoding Half Images (Powers of 2)

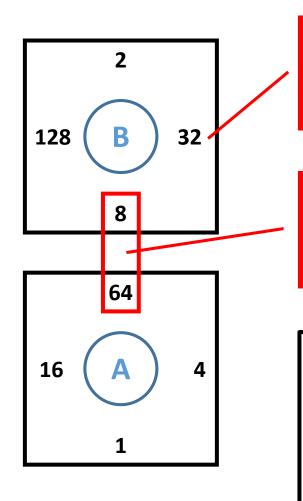

By encoding each half image with an increasing power of 2, valid complimentary image matches will have a sum of \*ONLY\*

3, 12, 48, or 192 between adjacent binding sites.

Half Image Identifier		Value
Dalmatian Head		1
Dalmatian Body		2
Shar-Pei Head		4
Shar-Pei Body		8
Spaniel Head		16
Spaniel Body		32
Shephard Head		64
Shephard Body	Change your numbers to	128
	increasing powers of 2	

## Complimentary Half Images

These <u>are</u> the half image power of 2 values stored in each binding site, for the current rotation of tiles A & B

Sum the NORTH binding (half image value) of Tile A and the SOUTH binding (half image value) of Tile B

Checking the NORTH (0) binding site:

Tile A North binding = 64

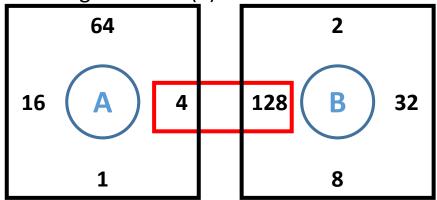

Tile B South binding = 8

Since the <u>sum</u> (64 + 8 = 72) is **not** one of the allowed values {3, 12, 48, or 192},

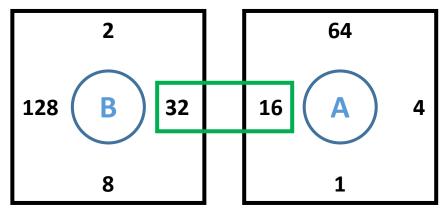

Tile A **cannot** be placed in this position!

Magic Numbers: 3, 12, 48, or 192

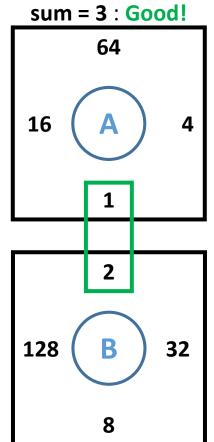

Checking EAST site (1) sum = 132 : No Good!

Checking WEST site (3) sum = 48 : Good!

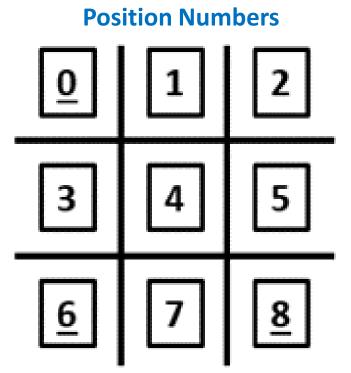

Checking SOUTH site (2)

### Encoding Tile Id and Position #

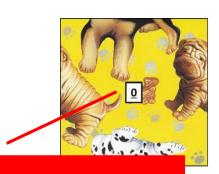

- Every tile has an Id (0 8)
- Every position has a # (0 − 8)

#### Preparing Your Scramble Squares

- Place a Post-It note on the center front of each of your tiles
  - Gently remove any existing post-it notes
  - Please do not write on the puzzle pieces themselves!
- Write a single number (0-8) in the middle of each
   Post-It note to designate the Tile Id #
  - Be sure to <u>underline</u> each Tile Id # to clearly designate the original orientation of each tile
  - The underline will help you remember which half image was in the North position for each Tile Id #

### Initial State Assignment is Arbitrary

I placed each tile in a random orientation, and then put an Id number on it

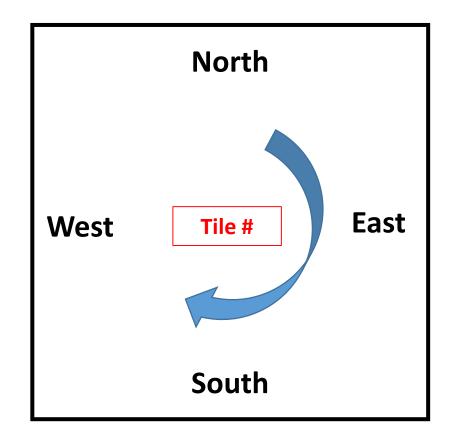

Though totally arbitrary, this initial state encoding must remain consistent

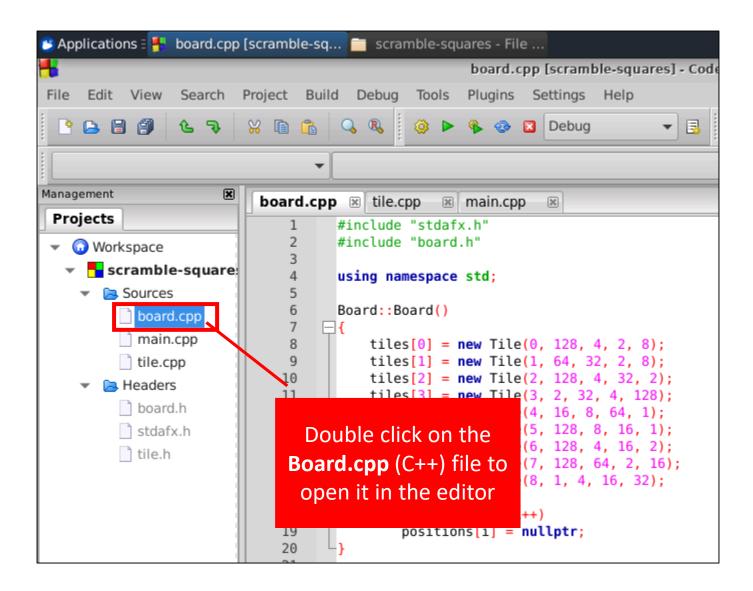

### **Encoding Bindings**

- Each tile has 4 binding sites that each contain a half image value
- For each tile, you will enter your half image values in clockwise order: N, E, S, W
- You must provide four half image values for all nine tiles
- The sequence is North, East, South, West

### Open Lab 2 – Scramble Squares Solver

#### Edit Lab 2 – board.cpp

Board::Board()
{
 tiles[0] = new Tile(0, 128, 4, 2, 8);
 tiles[1] = new Tile(1, 64, 32, 2, 8);
 tiles[2] = new Tile(2, 128, 4, 32, 2);
 tiles[3] = new Tile(3, 2, 32, 4, 128);
 tiles[4] = new Tile(4, 16, 8, 64, 1);
 tiles[5] = new Tile(5, 128, 8, 16, 1);
 tiles[6] = new Tile(6, 128, 4, 16, 2);
 tiles[7] = new Tile(7, 128, 64, 2, 16),
 tiles[8] = new Tile(8, 1, 4, 16, 32);

Creates 9 tiles but does not assign them to a position yet.

Half image value at **NORTH** binding site per initial arbitrary state

Half image value at **EAST** binding site per initial arbitrary state

Half image value at **SOUTH** binding site per initial arbitrary state

Half image value at **WEST** binding site per initial arbitrary state

#### **EXAMPLE ONLY**

- Dalmatian Head = 1
  - Spaniel Head = 16
- Dalmatian Body = 2

Shar-Pei Head = 4

Shepherd Head = 64

Spaniel Body = 32

- Shar-Pei Body = 8
- Shepherd Body = 128

#### Edit Lab 2 – board.cpp

```
| Tile Id | Please |
```

Please do not
delete the Tile Id #
(the first number in
the parentheses)
for each row – that
# must remain!

#### **EXAMPLE ONLY**

- Dalmatian Head = 1
- Spaniel Head = 16
- Dalmatian Body = 2
- Spaniel Body = 32
- Shar-Pei Head = 4
- Shepherd Head = 64
- Shar-Pei Body = 8
- Shepherd Body = 128

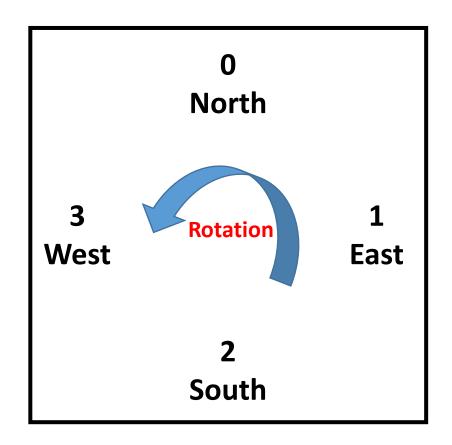

#### Edit Lab 2 – board.cpp

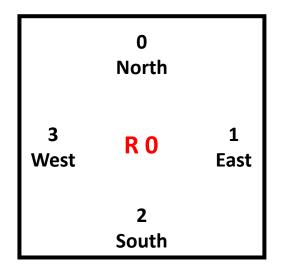

```
board.cpp 🗷
                            Do not change
          #include "stda
                               the first
                                                           Update only the
          #include "boar
                               number
                                                         last four values on
          using namespace std;
                                                          all 9 lines of code
                                                         to reflect your tiles
          Board::Board()
               tiles[0] = new Tile(0, 128, 4, 2, 8);
               tiles[1] = new Tile(1, 64, 32, 2, 8);
               tiles[2] = new Tile(1, 128, 4, 32, 2);
   10
   11
               tiles[3] = new Tile(1, 2, 32, 4, 128);
               tiles[4] = new Tile(\frac{1}{4}, 16, 8, 64, 1);
   12
   13
               tiles[5] = new Tile(\frac{1}{2}, 128, 8, 16, 1);
   14
               tiles[6] = new Tile(\mathbf{6}, 128, 4, 16, 2);
   15
               tiles[7] = new Tile(\frac{1}{2}, 128, 64, 2, 16);
   16
               tiles[8] = new Tile(\{1, 1, 4, 16, 32\});
   17
               for(int i=0; i<9; i++)
   18
   19
                   positions[i] = nullptr;
   20
```

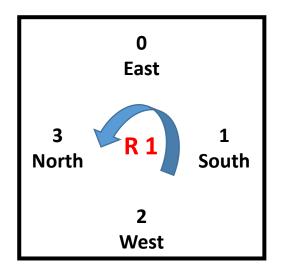

## **Encoding Bindings and Rotations**

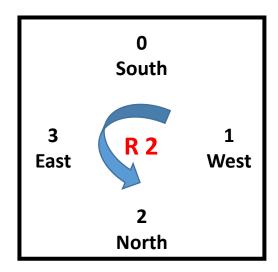

- When the program solves your puzzle, it will indicate where to place each tile # and how to <u>rotate</u> that tile
- Quarter turn counterclockwise rotations are numbered 0 – 3
- R 0 means that this tile is not rotated

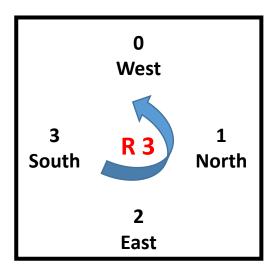

# **Encoding Bindings and Rotations**

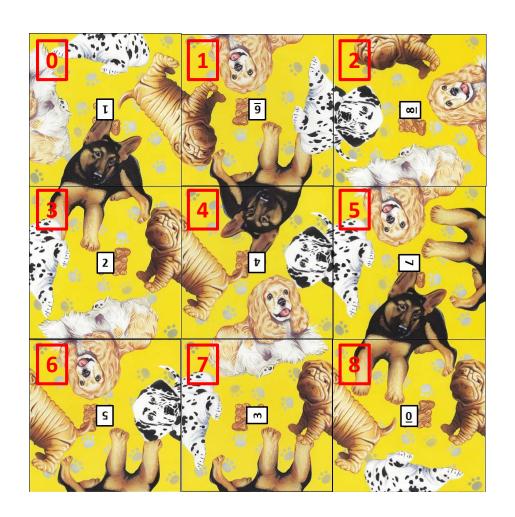

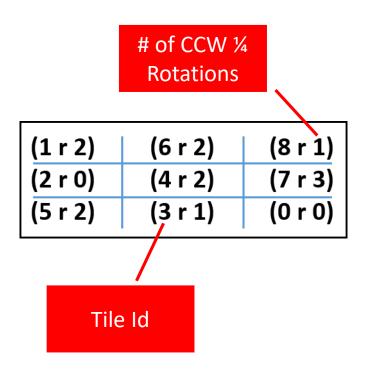

#### A Solution Written in Matrix Form

## Using Recursion To Solve Scramble Squares

- The code recurses from position to (position + 1), trying to place every tile in that position, in every rotation, that can fit the board thus far
- The code does not waste time creating & checking tile permutations which cannot possibly work
- The terminating condition in the recursive Solve() function causes the code to "bottom out" and then return "back up" the call stack when no more tiles or rotations can be found that work in the current board layout

# A Recursive Solve()

## A Recursive Solve()

```
void Board: Solve(int position)
    for (int tileNum = 0; tileNum < 9; tileNum++)</pre>
        Tile* tile = tiles[tileNum];
        if (!tile->Placed)
            for (tile->Rotation = 0; tile->Rotation < 4; tile->Rotation++)
                if (CanPlaceTile(tile, position))
                    tile->Placed = true:
                    positions[position] = tile;
                    if (position == 8)
                        Print();
                    else
                        Solve(position + 1);
                    positions[position] = nullptr;
                    tile->Placed = false;
```

## Wouldn't **Brute Force** Be Simpler?

- When writing code to solve a problem, your first step should be to consider the brute force approach.
  - Enumerate every possible layout of tiles and rotations
  - If the current layout is valid then Print() the board
  - Keep looping until all permutations are tried
- The code might be shorter, but the run time would be exponentially longer.
  - Polynomial run times might be tractable if you distribute the problem across thousands of computers
  - However exponential run times cannot currently be solved by brute force – perhaps someday by quantum computers...

### Now you know...

- Before diving into a problem, take the time to form meaningful research questions to help you analyze the situation systematically – see things as a scientist!
- Binary encoding often provides a way to have unambiguous input and output
- Recursion is a powerful concept that enables efficient search algorithms
- You cannot conquer problems whose solution space grows exponentially (combinatorial explosion) via brute force alone – you need to find a smarter way to quickly rule out permutations that cannot possibly be valid
